Abstract

Aim: The objective of the present investigation was to extract the mucilage from flower petals of *Bombax Ceiba* and explore its use as a promising excipient for Pharmaceutical preparation. Natural polymers have constantly a remarkable property which makes them particular from synthetic polymer and Bombax Ceiba flower mucilage is one such model that shows increasingly important properties making it a helpful excipient for a wide scope of utilizations.

Materials and Methods: The flowers of *Bombax Ceiba* were collected from the Regional Ayurveda Research Institute for Drug Development (RARIDD), Gwalior region of India and were authenticated at the Botanical Survey of India, Central Regional Centre, Allahabad, U.P (Authentication voucher No. B.S.I/C.R.C/TECH./2018-19/559 with Accession No. 103976).*Bombax Ceiba* flower petals mucilage is isolated by the Microwave-assisted method and tablet prepared by Experimental runs were designed by Design Expert 10.0.1 [Stat Ease.Inc.] software following full factorial method. 3^2 full factorial designs were applied for examining two variables (factors) at three levels with a minimum of 9 runs. The tablets containing paracetamol as the main active constituent were prepared by a wet granulation method using isolated mucilage in different composition (F1 – F9) or starch (F10) or PVP K 30 (F11) as an internal binder.

Results: The flow properties of the drug excipients mixture were studied in term of bulk density; tapped density; car's index and angle of repose to establish the flow property reflect the appropriateness of formulation. All prepared batches of tablet formulations evaluated for the post-compression parameters have shown acceptable and within the Pharmacopoeial limit. The release characteristics of formulations were studied using dissolution test apparatus is paddle type (USP XXII type) at 50 rpm. The cumulative percent drug release of formulations i.e. F1, F2, F3, F4, F5, F6, F7, F8, F9, F10 and F11 were 91.31%, 92.67%, 94.22%, 88.83%, 90.36%, 91.11%, 90.54%, 92.11%, 93.98%, 78.66% and 80.36% respectively in 60 minute. The result justified the effect of optimized formulation F3 is significantly more effective than starch and similarly effective a synthetic polymer.

Conclusions: The results suggestd that *Bombax ceiba* mucilage could be useful as an alternative binding agent in tablets with better mechanical properties and release profiles.

Keywords:*Bombax Ceiba* flower, paracetamol,3^2 full factorial designs,polymer, eco-friendly, Natural excipient.

INTRODUCTION

Formulation of functioning pharmaceutical content into wanted measurement structures is once in a while conceivable without the expansion of excipients. They are a crucial piece of the restorative compound, which may likewise be a significant segment of the therapeutic product. These are dormant atoms that assume a significant job in the planning of measurements formss.[1]Today, we have various plant-based pharmaceutical excipients, which might be chosen and upgraded depending on the properties of the medication, necessities of the dosage form, and its site of activity. Aside from its regular capacities like filling in as an inert vehicle for the organization of the correct volume of dynamic pharmaceutical fixing with consistency in weight, excipients likewise satisfy multifunctional jobs, for example, discharge retardants, solvency enhancers, thickness modifiers, and so on. What's more, they offer huge favorable circumstances in the simplicity of assembling, upgrade of patient compliance, improved bioavailability, reproducibility, targeted delivery etc.[2]Mucilageis the most frequently utilized adjuvant in pharmaceutical preparations. Plant mucilage's are pharmaceutically significant polysaccharides with a wide scope of utilizations, for example, stabilizing, thickening gelling operators, binding, disintegrating, suspending, emulsifying, balancing out, and gelling specialists. They have been likewise utilized as lattices for continued and controlled release drugs.[3]Aside from its utilization in completed medicines, fresher uses have been found in the preparation of beautifying agents, textiles, and paint paper. Thus the interest for these substances is expanding and new sources are getting tapped.[4-5]Tremendous utilization of plant mucilage and gums in different enterprises is a direct result of minimal cost, prepared accessibility, and significant properties that they present on products. The interest for these substances is expanding and new sources are being created. India, in view of its geological and environmental position, has customarily been a decent hotspot for such items among the Asian nations. Naturally accessible mucilage's are wanted to synthetic materials due to their non-harmfulness, minimal cost, simplicity of accessibility, emollient and non-disturbing nature, and less administrative issues.[6]

The different species of Bombax are accounted for to have different medicinal properties viz. cholera, fractures, smallpox, coughs, urinary problems, influenza. The *Bombax Ceiba*is broadly developed as an elaborate plant all through the tropical and subtropical regions.[7]

In the current research work, an exertion was made to extract the mucilage from *Bombax Ceiba* flower petals by the microwave-assisted method. It was then evaluated to check the chance of utilizing this mucilage as authoritative/crushing specialists in tablet formulation. The fasteners are the pharmaceutical excipient that is usually utilized in a tablet formulation to improve the stream properties of the granules.The proposed work investigates the binding property of plant oriented mucilage material from petals of *Bombax ceiba* flower in oral drug delivery system. There are various examples of binding agents of plant and synthetic adapt for oral drug delivery system. The proposed methodology provides information on the effective concentration of plant mucilage and its collection methodology, which acts as a binding agent. The formulations were evaluated for post compression parameters like tablet thickness testing, uniformity of weight of tablet, hardness determination of tablet, friability of tablets, disintegration test for uncoated core tablets, determination of drug content, *in-vitro* drug release study.

MATERIALS AND METHODS

Materials

The flowers of *Bombax Ceiba* were collected from the Regional Ayurveda Research Institute for Drug Development (RARIDD), Gwalior region of India and were authenticated at the Botanical Survey of India, Central Regional Centre, Allahabad, U.P (Authentication voucher No. B.S.I/C.R.C/TECH./2018-19/559 with Accession No. 103976).Paracetamol was obtained as gift sample from Meghmani LLP, Bharuch, Gujarat. Sodium starch glycolate was obtained as gift sample from Maple biotech Pvt. Ltd. (Pune, India). All other chemicals used were of analytical grade, and distilled water was used throughout the experiments.

Isolation of Mucilage from *Bombax Ceiba*Flower Petals

The fresh petals of *Bombax ceiba* flower were gathered, washed with water to expel soil and flotsam and jetsam. The petals of flowers (150 g) were squashed and absorbed refined water (500 ml) for 24 hours. The splashed flowers were kept in a microwave alongside a glass tube inside to forestall knocking and the procedure of microwave illumination was begun at 420 W intensity for 7 min. The measuring utensil was confined from the oven and warded off for 2 hrs for the release of mucilage into water. The material was separated through a muslin pack and hot refined water (25 ml) was added through the sides of the marc and pressed well so as to obliterate the mucilage totally. An equivalent volume of ethanol was added to the filtrate, in this manner hasten of mucilage was appeared and it was kept inside a cooler for approx. 24 hours for successful settling. It was separated and dried absolutely in an incubator at 37±2°C, powdered, and gauged. The amount of mucilage acquired from the microwave was calculated.[8]

Factorial Designing for Optimizing the Combinational Study of Isolated Mucilage and Drug

Experimental runs were designed by Design Expert 10.0.1 [Stat Ease. Inc.] Software following full factorial method. 3^2 full factorial designs were applied for examining two variables (factors) at three levels with a minimum of 9 runs. The actual and coded experimental levels based on 3^2 full factorial designs three-level approach was given in Table 1 and 2.

Table 1:3^2 factorial designs and experimental condition

S. No.	Factors	Low level (-)	Mid-level (0)	High level (+)

Preparation of Uncoated Tablet

The tablets containing 500 mg of paracetamol as main active constituent were prepared with by a wet granulation method using isolated mucilage in different composition (F1 – F9) or starch (F10) or PVP K 30 (F11) as internal binder. The Micro crystalline cellulose was used as diluents or filler and sodium starch glycolate is used as disintegrant at granulation process of proposed work. The wet granulated mass was passed through a mesh # 10 and dried at 60 ºC for 1h in a hot air oven. The dried granules were sized by passing through a sieve # 14. The complete batch of dried granules was collected and mixed with 5 % magnesium stearate and 4 % talc and 0.1 % sucrose in glass petridish. These lubricated granules were compressed into tablets on single-station punch machine (Anant Electricals Pvt. Ltd.) using 4 mm deep concave and 1.2 mm round, flat and plain punches.[9-10] (Table 3).

Characterization of Uncoated Tablets
Pre compression Parameters
Flow Properties of Granules

The flow properties of granules were characterized in terms of bulk density, tapped density, compressibility index, angle of repose and Hausner's ratio. The tapping method was used to determine the bulk density, tapped density, percent compressibility index, Hausner's ratio.

Determination of Bulk Density and Tapped Density

An accurately weighed quantity of the powder (W) was carefully poured into the graduated cylinder and volume (V_0) was measured. Then the graduated cylinder was closed with lid and set into the tap density tester. The density apparatus was set for 100 tabs and after that the tapped volume (V_f) was measured and continued operation till the three consecutive readings were equal.[11] The bulk density (BD) and the tapped density (TD) were calculated using the following formulae,

$$\text{Bulk density} = W/V_0, \text{ and Tapped density} = W/V_f$$

Where, W= Weight of the powder V_0 = Initial volume, V_f= final volume

Compressibility Index

Compressibility index of the powder of pure drug was determined by Carr's compressibility index.[12]

$$\text{Carr's index (\%)} = [(TD-BD) \times 100]/TD$$

Hausner's Ratio

It is the ratio of tapped density and bulk density. Hausner's found that this ratio was related to inter particle friction and, as such, could be used to predict powder flow properties. Generally, a value less than 1.25 indicates good flow properties, which is equivalent to 20% of Carr's index.

Angle of Repose

Static angle of repose of the powder of the drug sample was determined by the funnel method.It reflects the flow ability of a powder. The accurately weighed powders of the drug sample were taken in the funnel. The height of the funnel was adjusted in such a way that the tip of funnel just touched the apex of the heap of the powders of the drug sample. The powders of drug sample were allowed to flow through the funnel freely on to the surface. The diameter of the powder cone was measured and angle of repose was calculated using the following equation,

$$\tan \theta = h/r$$

Where, h= Height of pile and r= Radius of the pile

Post Compression Parameters

Thickness

The thickness of the tablets was determined using screw gauze.

Hardness

The hardness of tablets is indicates the tensile strength of a tablet. It is expressed in terms of load/pressure required to crush it when placed on its edge. The tablet hardness was evaluated using the Monsanto hardness tester. The tablet hardness is expressed in kg / cm^2.

Uniformity of Weight

Uniformity of weight was determined by sampled 20 tablets from each batch and accurately weighed using an analytical balance and average weights were calculated for determination of weight variation.

Friability Test

Ten tablets from each batch were accurately weighed and placed in the friability test apparatus (Roche friabilator).The apparatus was operated at 100 rpm for 4 minutes. The tablets were taken after 100

rotations, de-dusted and reweighed. A maximum loss of weight (from a single test or from the mean of the three tests) was not greater than 1.0 %.

Disintegration Test

The disintegration test was performed using disintegration test apparatus following the method specified in I.P. etc. using 900 ml of 0.1 N hydrochloric acid.

Drug Content Assay

Ten tablets were finely powdered, and a quantity of powder equivalent to 500 mg of paracetamol (F1 to F11) was accurately weighed. The weighed sample was transferred to 100 ml volumetric flasks containing approximately 50 ml of 0.1 N HCl solution. The flasks were shaken for solubilizing the drug and sonicated for 10 min. The volume was diluted made up to 100 ml by 0.1 N HCl and mixed thoroughly. The drug samples were diluted with the same solvent up to 10 µg / ml. The solutions were filtered through a 0.45 µm membrane filter and analyzed for the content of paracetamol at 257 nm by using double beam UV spectrophotometer (UV-1800, SHIMADZU, Japan).

***In-vitro* Drug Release Study**

An IP paddle apparatus has been used to study *in-vitro* drug release from uncoated tablet. In the present study, drug release was studied using a modified IP dissolution rate test apparatus (apparatus type II) at 100 rpm in 0.1 N HCl as dissolution fluid (900 ml) maintained at 37±0.5°C. Withdrawn samples (1 ml) were filtered, and analysed by UV-visible spectrophotometer at 257 nm. The volume was replaced with the same amount of fresh dissolution fluid each time to maintain the sink condition.

Characterization of Release Profiles

The characterization of release profile of the entrapped drug from coated formulations was evaluated. The release profile of tablets was characterized by release lag time (T_{lag}) and release rate k. Release data within the linear range were selected and fitted to a zero-order mathematical model:

$$Q = C + kt$$

Where Q is the release percentage at time t; k is the slope of the fitted linear equation and here represents release rate; and C is the intercept of the linear equation. $T_{lag}$is defined as the time of the start of ciprofloxacin release and calculated here from the fitted equation, setting Q=0:

$$T_{lag} = - C / k.$$

The linear equation is based on regression of at least three release data, and only correlation coefficient of over 0.99 is acceptable for T_{lag} and k calculation.

Stability Studies

A established drug delivery system should retain its reliability, morphology, & occasionally should save various character is quality and quantity of entrapped drug etc. The major emphasis has been directed towards the stability testing. A study of stability of pharmaceutical invention is crucial for three important reasons i.e. protection of patients, authorized needs apprehensive with the distinctiveness, potency, transparency and features of the drug. The superiority of the drug material or products varies with time of storage and its conditions such as temperature, humidity and light. So, there is a need to establish a shelf life for the drug product and recommended storage conditions.

RESULTS AND DISCUSSION

Characterization of Uncoated Tablets

Pre compression Parameters

Flow properties of powder reflect the appropriateness of formulation. So, the flow properties of the drug excipients mixture were studied in term of bulk density, tapped density, car's index and angle of repose to establish the flow property. The bulk density of formulations was found from 0.521 g/ml (F7) to 0.546 g/ml (F9) range while their tapped density ranged between 0.621 g/ml (F4) to 0.659 g/ml (F11). The Carr's index (%), Hausner's ratio and angle of repose were found 13.76 (F3) to 17.90 (F11), 1.15 (F3) to 1.21 (F7) and 23.1° (F3) to 28.2° (F10) respectively. The observation showed that, as the Carr's index (%), Hausner's ratio and angle of repose (ɵ) were within in the range of standard

value of Good flow-ability. The result of flow properties of powder mixtures of all formulations is given in Table 4.

Table 4: Flow properties of granules of paracetamol

Batch	Bulk density	Tapped density	Carr's index (%)	Hausner's ratio	Angle of repose (θº)
F1	0.540±0.026	0.631±0.032	14.42±0.318	1.16±0.002	27.5±0.516
F2	0.545±0.010	0.640±0.019	14.84±0.534	1.17±0.004	26.2±0.430
F3	0.539±0.015	0.625±0.008	13.76±0.673	1.15±0.001	23.1±0.611

Values are expressed as mean ± S.D., n=3

Post Compression Parameters

Post Compression Parameters

The formulations were evaluated for post compression parameters like Tablet thickness testing, Uniformity of weight of tablet, Hardness determination of tablet, Friability of tablets, Disintegration test for uncoated core tablets, Determination of drug content, *in-vitro* drug release study, Characterization of release profiles of were studied.

Thickness

All the prepared tablets are characterized by their size and shape, which found round shape and uniform thickness in the range of 5.35 (F8) to 5.49 (F10) mm. The thickness of the formulations (in mm) is graphically represented in figure 1.

Hardness

Tablets require certain hardness to withstand the mechanical shocks in handling, packaging and in transportation. The hardness of formulations was within the range of 3.18 (F1) to 4.13 (F10) kg/cm^2. The hardness of the formulations (in kg/cm^2) is graphically represented in figure 1.

Uniformity of Weight

The weight variation of tablets was determined according to the specification in USP and all the tablets were found to comply with specification. The tablets weight range of average is 5% produced were of uniform weight with acceptable weight variation. Weight variation of tablets was determined according to the specification in USP and all the prepared tablets were of uniform weight with acceptable weight variation range is 5% [United State pharmacopoeia, 2007]. Average weight of the all formulations is graphically represented in figure 2.

Friability Test

The friability of all formulations was found to be less than 1%. This is in the acceptable limit. The result shows resistance to loss of weight indicated the tablet ability to withstand abrasion in handling, packaging and shipment. All the tablets formulations found friability from 0.24% (F3) to 0.88% (F7). The % friability of all formulations is graphically represented in figure 3.

Disintegration Test

Disintegration time was varied from 3.59 (F1) to 5.23 (F10)min. Disintegration time for all formulations is graphically represented in figure 4.

Drug Content Assay

Percentage drug content for various formulations i.e. F1, F2, F3, F4, F5, F6, F7, F8, F9, F10 and F11 were found to be 95.42%, 92.95%, 94.63%, 91.67%, 93.02%, 94.46%, 90.56%, 92.09%, 89.01%, 90.89% and 93.09% respectively. The % drug content of all formulations is graphically represented in figure 5.

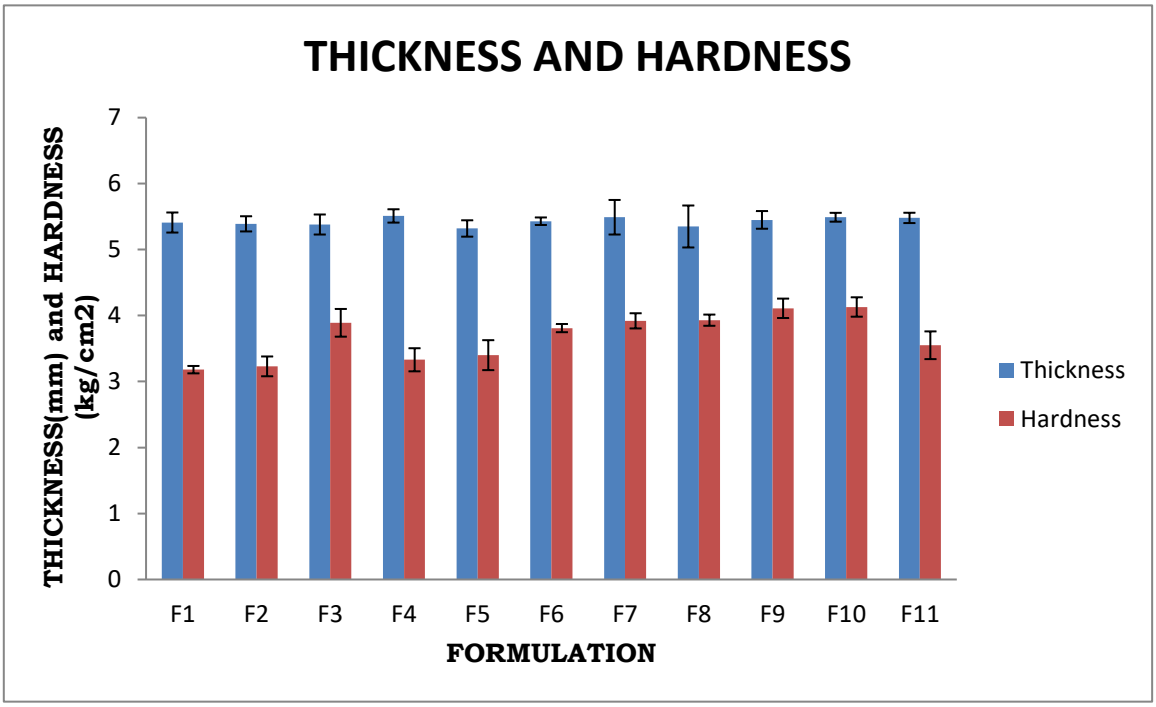

Figure 1: Thickness and hardness of various formulations

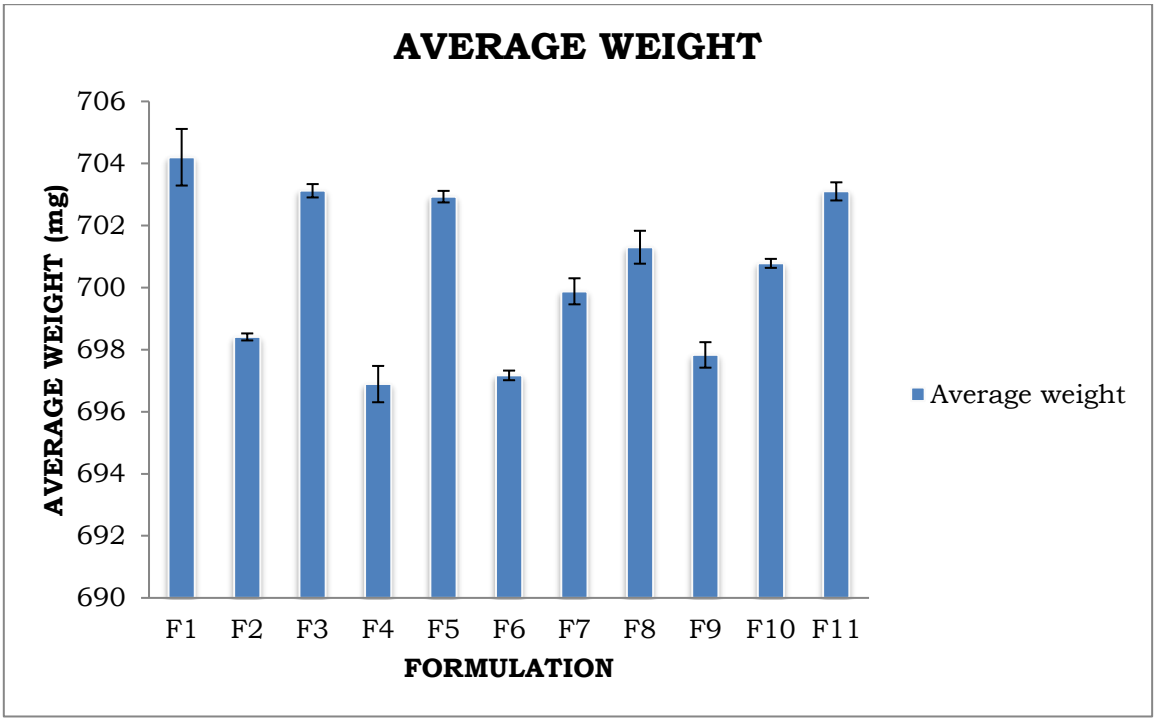

Figure 2: Average weights of various formulations

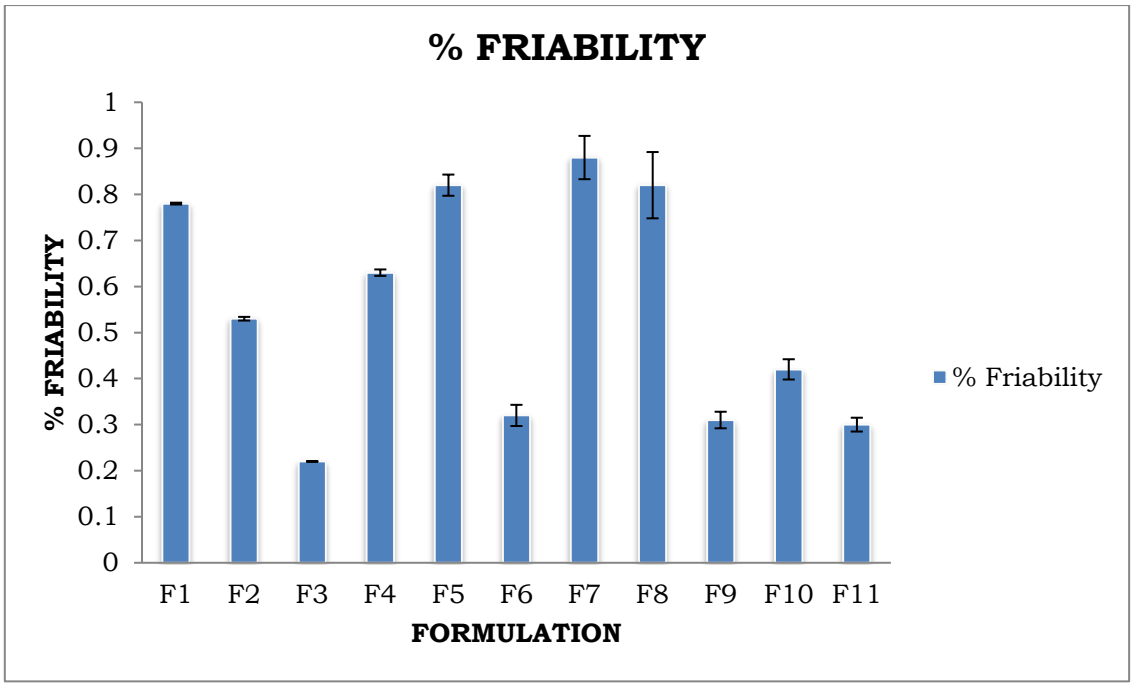

Figure 3:% Friability of various formulations

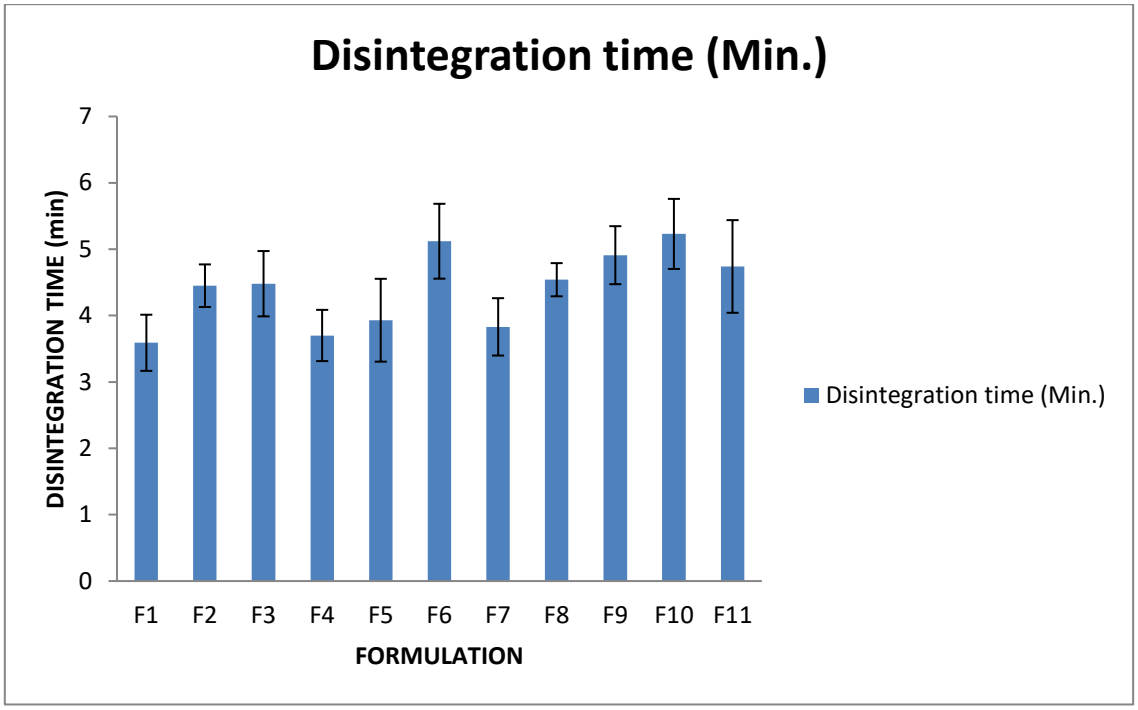

Figure 4: Disintegration time of various formulations

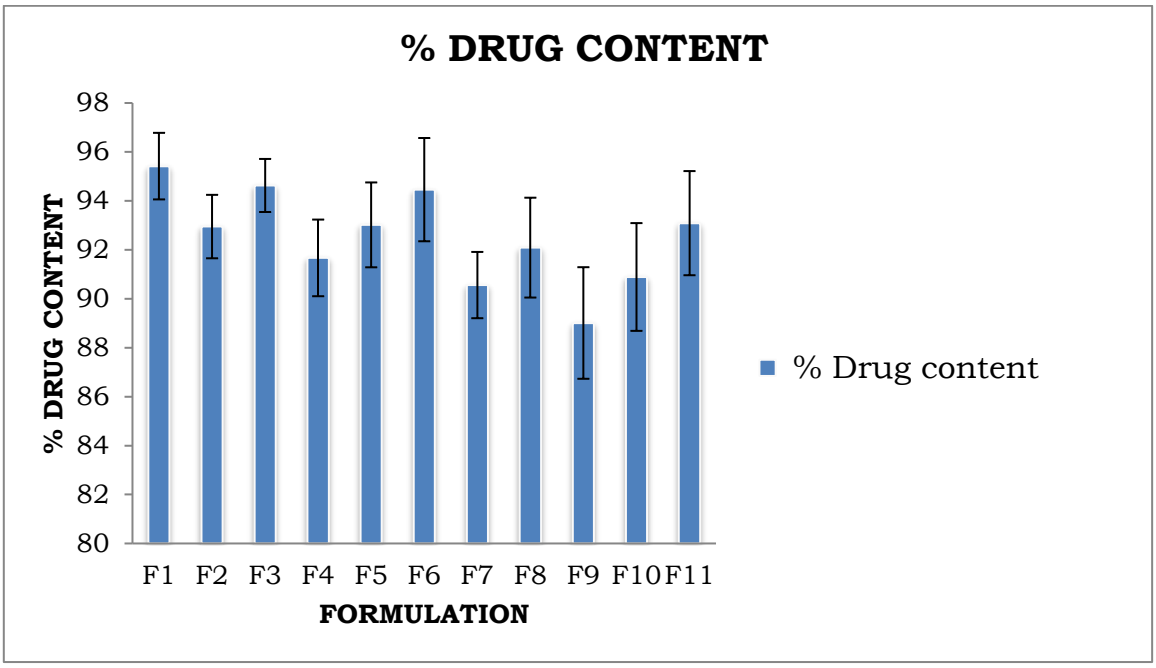

Figure 5:% Drug content of various formulations

***In-vitro* Drug Release Study**

The release characteristics of formulations was studied using tablet dissolution test apparatus is paddle type (USP XXII type) at 50 rpm. 0.1N Hcl solution900 ml was used as the dissolution media with temperature maintained at 37.0±0.5^{0}C. The cumulative percent drug release of formulations i.e. F1,

F2, F3, F4, F5, F6, F7, F8, F9, F10 and F11 were 91.31%, 92.67%, 94.22%, 88.83%, 90.36%, 91.11%, 90.54%, 92.11%, 93.98%, 78.66% and 80.36% respectively in 60 minute. All the results of Cumulative percent drug release of all formulations are graphically represented in figure 6.

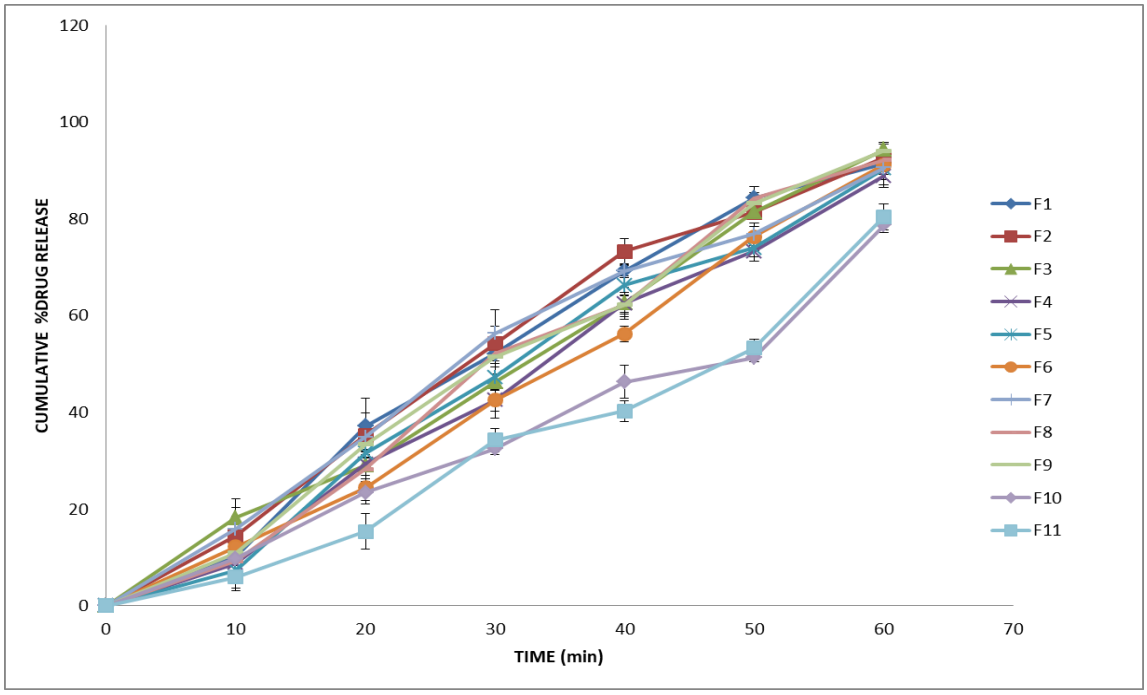

Figure 6: Cumulative % drug releases of different formulations

Characterization of Release Profiles

Kinetic study of drug release from dosage forms is useful as they influence the dosage interval, bioavailability, overall patient adherence and the occurrence of toxic and untoward effects. In addition, kinetic parameters can be used to study the influence of formulation factors on the drug release for optimization as well as control of release. The criterion for selecting the most appropriate model was on the basis of goodness of best fit which was determined by the highest correlation coefficient. The kinetic parameters and correlation coefficient (r^2) derived from the equations are presented in Tables 5 and 6.

Saveral mathematical models have been developed by some researchers, i.e.
Zero order (Cumulative % drug release versus time)
First order (Log cumulative % drug remaining versus time)
Korsmeyer-Peppas model (Log cumulative % drug release versus log time)
Higuchi plot (Cumulative % drug release versus square root of time).

The results of the performed study showed that the first-order (r^2 = 0.995-0.929) gave the best fit for the formulations made through isolated mucilage while the drug release for tablets prepared by starch & PVP-K30 also fitted the first order model with r^2 ranging between 0.994 - 0.995. This indicates that the release of the drug from the tablet is dependent on the concentration of drug in the formulation. This is consistent with previous reports on the release kinetics of Paracetamol formulations. To confirm the diffusion mechanism, the data were fitted into Korsmeyer-Peppas model equation which gave a release exponent (n) values ranging from 1.691 to 1.711 which indicates that the drug release mechanism from the formulations was by super case II transport, in which a pronounced acceleration

in drug release from the formulation occurred towards the latter stages of release, resulting in a more rapid relaxation-controlled transport.

Table 5: Fit of various kinetic models for uncoated tablets of paracetamol (F1- F11)

Stability Studies

The uncoated tablet(F3)is the oral drug delivery system that was prepared with combination of plant oriented mucilage as a binding agent and paracetamol as API. The formulation was used for stability study at temperature 4°C, 25°C & 60% RH and 40°C & 75% RH, 50°C & 75% RH, 60°C & 75% RHfor a period of 180 days. The stability of a formulation is known as the power of the materials to stay on inside definite restrictions over a fixed phase of time and known as shelf life of the product. The data of stability studies were presented graphically in figure 7 and 8. The data identified that the F3 stored at temperature 25°C & 60% RH, it was less than 5 % degradation at the end of six months. It may indicate that the formulations could provide a minimum shelf life of 2 years.

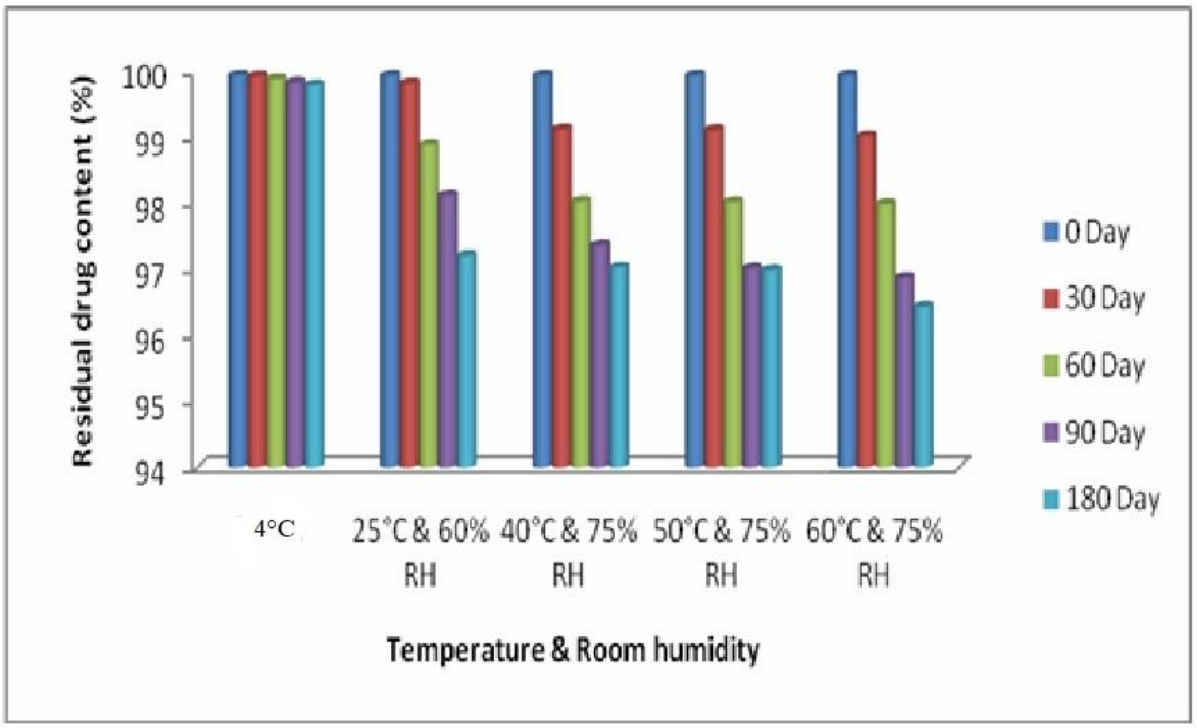

Figure 7: Bar graph showing residual drug content of uncoated tablet (F3) at temperature 4°C, 25°C & 60% RH and 40°C & 75% RH, 50°C & 75% RH, 60°C & 75% RH

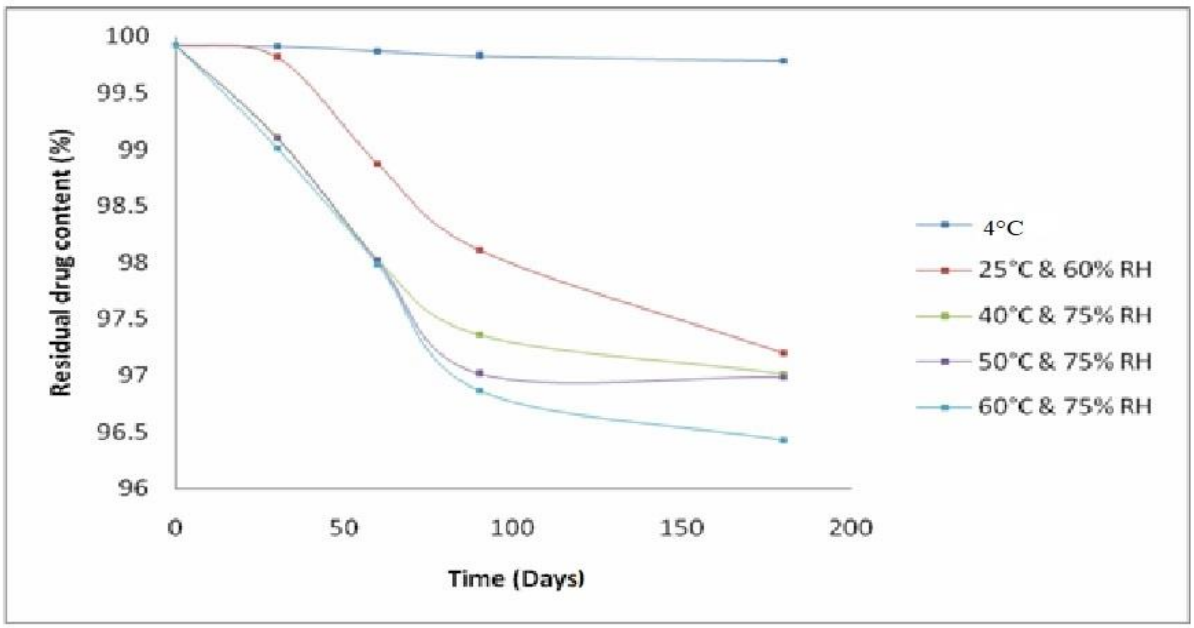

Figure 8: Degradation curves for stability studies of uncoated tablet (F3) at temperature 4°C, 25°C & 60% RH And 40°C & 75% RH, 50°C & 75% RH, 60°C & 75% RH

CONCLUSIONS

Based on all available classical and contemporary references, we may conclude that all medicinal values of *Bombax ceiba* are true. The work demonstrates the successful development and optimization of the flower mucilage -loaded paracetamol tablets. It can be found that the yield obtained from the microwave method for extraction of mucilage is much better as compared to the conventional method because it works on the cellular level for extraction of the mucilage where as the conventional method is less efficient. After all, it only uses heat externally for the extraction of mucilage. Hence we can conclude the microwave-assisted method is more suitable, fast economicaly and simple for extraction of mucilage as compared to the conventional method.

The current study shows the effect of *Bombax ceiba* mucilage as a binder in the development of paracetamol tablets in comparison with other standard binders. From the results, it is concluded that *Bombax ceiba* mucilage has a better binding property in comparison with starch and is almost equal to PVP K-30. The results of hardness significantly affect the result of friability and disintegration time of uncoated formulations. The friability of Formulation F3 is more effective than the formulations F10 and F11. The result justified that mucilage of *Bombax ceiba* flower obtained by Microwave-assisted method in 15 % concentration is a more promising binding agent as compared to starch and PVP K30. Drug release properties of the tablets were assessed using disintegration time and dissolution time as assessment parameters. The crushing strength, disintegration and dissolution times of the tablets increased with increased binder concentration while their friability decreased. *Bombax ceiba* mucilage produced tablets with better mechanical properties and shorter disintegration and dissolution times than those containing starch and PVP K-30. The results suggest that *Bombax ceiba* mucilage could be useful as an alternative binding agent in tablets with better mechanical properties and release profile.

FUTURE PERSPECTIVE

The research work consists of *Bombax Ceiba* flower mucilage tablets loaded with paracetamol can be further elaborated once it's *in-vivo* test is performed to calculate the bioavailability and therapeutic effect of formulation. Some literatures are also found in favour of the disintegrant property of *Bombax Ceiba* flower mucilage along with its binding property. So that in future we can also go for further studies to evaluate its disintegrant nature.

If the results are satisfactory it could further go for clinical trials or phase analysis after that it could be patented It contain an innovative concept of using flower mucilage as binder in tablets which may decrease toxic effects that may occur due to the use of synthetic binders this increases the acceptance of natural, biodegradable & biocompatible material as a pharmaceutical excipient.
